

ABSTRACT OF THE INVENTION

The invention relates to a socket with double functions, which
5 includes a socket and a connecting cable, wherein the socket has a central
hollow shaft for receiving a signal piece therein. A conductive frame is
provided around the shaft and a cap being placed on front side of the
socket. A connecting cable can insert into the socket to obtain electrical
connection as well as signals transferring. So the communicating
10 machine can be manufactured more conveniently and the volume can be
efficiently decreased.
